

Bitcode

The plain-English one-pager

A stock market for code — where AI companies buy and sell the code they need to get smarter: measured, priced in the open, and traded in minutes.

What it is. AI models need code and data to get smarter. Meanwhile, huge amounts of valuable code sit idle inside companies and in old, abandoned projects. Bitcode is the marketplace that connects the two — and, for the first time, gives that code a real price and a real market.

The problem it fixes. Buying the code that trains AI is broken. Today the only options are: sign a licensing deal (~9 months, and it often collapses), scrape it (and get sued — Anthropic paid \$1.5B), or buy the whole company (Meta paid \$14.3B for one). And the open web runs out of fresh data around 2028. There are no prices, no liquidity, no market — the most valuable input to AI is still bought by hand.

Why it's big. Roughly \$100B is spent on this problem today, growing ~25% a year. Code is the highest-value kind of data — and nobody has built a real market for it. Wide open.

How it works — three steps.

- **Deposit.** Connect your code, hide the secret parts, and Bitcode turns it into an *AssetPack* — a package scored for how good and how valuable it is.
- **Read.** A buyer says what they need; Bitcode assembles the packs that fit and shows exactly how well each one fits — **before anyone pays**.
- **Settle.** The buyer pays in crypto — BTC, ETH, or SOL. The seller keeps ownership and earns; the buyer gets the rights plus \$BTD. A couple of clicks — no lawyers, no NDAs.

The tokens, in plain words. BTC, ETH, or SOL — the crypto you pay with. **AssetPacks** are the code packages you own. \$BTD is a scarce token you earn when you buy — it represents how much measured knowledge changed hands. It is **not** a meme coin: every token is backed by measured, real value.

Why Bitcode wins. Faster (minutes, not months), open pricing (not secret deals), the easiest way to buy or sell IP (a couple of clicks), and the only market that both measures quality and lets you truly own and resell what you buy.

The plan. Launch the full product now (~1 month out) with first customers and first revenue; win a first cohort of users who love it; deepen the measurements so the market sharpens around real demand; then expand from code to all technical knowledge — every field of STEM — with \$BTD aiming to become one of the world's largest cryptocurrencies.

Who's behind it. Gerald Davis, founder of Advanced Engineered Software, Inc. — forged by a prior startup, and built specifically for this, where art meets science.

Money has Bitcoin. Knowledge has Bitcode.
